Complexities

# MergeSort

WITH THE OLDIES

# Mergesort

- efficient, general-purpose
- comparison-based sorting algorithm
- sorts by breaking it into halves, sort, and then merging together
- works in recursion
- divide and conquer

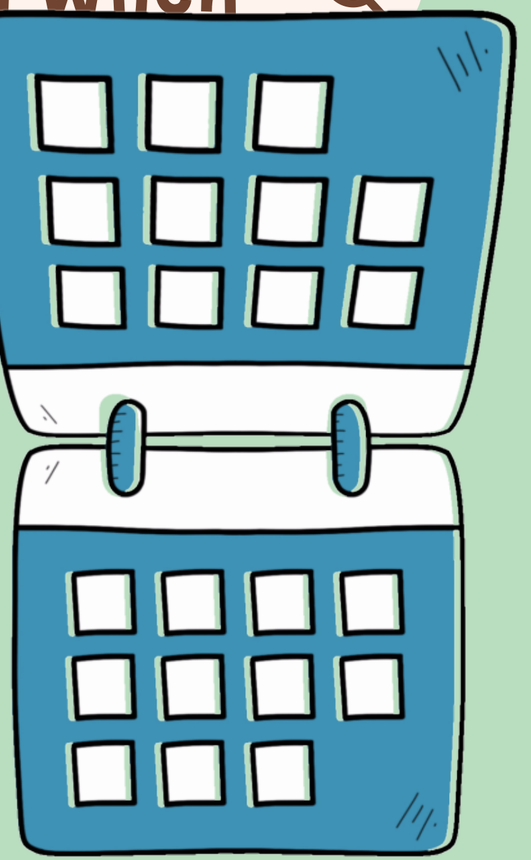
# Mergesort - Who and When

## John von Neumann

# Mergesort - Who and When

Created in the year

**1945**



# Mergesort - Who and When

- prepared programs for internal merge sorting (1945)
- to test adequacy of some instruction codes
- EDVAC computer

(The Art of Computer Programming by Knuth, 1968)

# Original Version of Mergesort

Based on

Mastering Algorithms in C

Kyle Loudon, 1999

# Original Version of Mergesort

```
static int merge(void *data, int esize, int i, int j, int k,
int (*compare)(const void *key1, const void *key2)) {
        char *a = data,*m;
        int ipos,jpos,mpos;
        ipos = i;
        jpos = j + 1;
        mpos = 0;

 if ((m = (char *)malloc(esize * ((k - i) + 1))) == NULL){
  return -1;
 }
```

Declare and initialize counters used for merging

Allocate storage for merged elements

# Original Version of Mergesort

```
while (ipos <= j || jpos <= k) {
  if (ipos > j) {
     while (jpos <= k) {
        memcpy(&m[mpos * esize], &a[jpos * esize], esize);
        jpos++;
        mpos++;
  }
  continue;
}
```

While either division has elements to merge

If the left division has no more elements to merge, copy the next ordered element in the right division

# Original Version of Mergesort

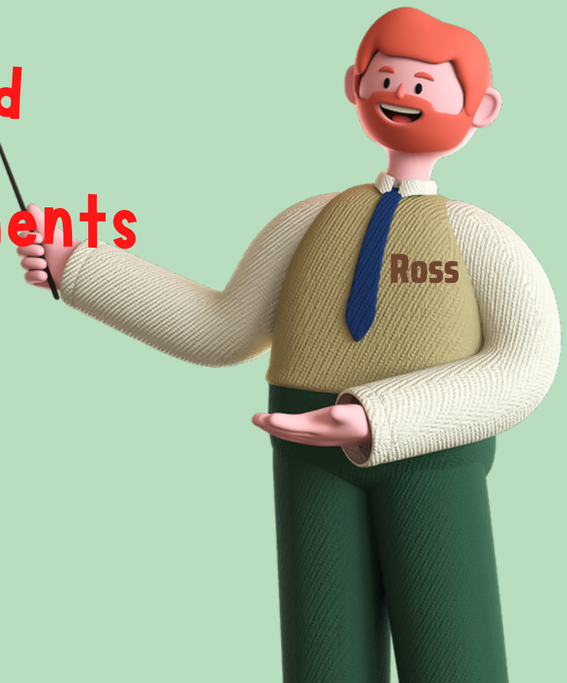
```
else if (jpos > k) {
    while (ipos <= j) {
    memcpy(&m[mpos * esize], &a[ipos * esize], esize);
     ipos++;
     mpos++;
    }
    continue;
  }
```

If the right division has no more elements to merge, copy the next ordered element in the left division

# Original Version of Mergesort

```
if (compare(&a[ipos * esize], &a[jpos * esize]) < 0) {
    memcpy(&m[mpos * esize], &a[ipos * esize], esize);
    ipos++;
  mpos++;
  }
  else {
    memcpy(&m[mpos * esize], &a[jpos * esize], esize);
    jpos++;
    mpos++;
  }
}
```

Append the next ordered element to the merged elements



# Original Version of Mergesort

```
        memcpy(&a[i * esize], m, esize * ((k - i) + 1));
```

Prepare to pass back merged data

```
        free(m);
        return 0;
}
```

Free storage allocated for merging

# Original Version of Mergesort

```
int mgsort(void *data, int size, int esize, int i, int k, int
(*compare)(const void *key1, const void *key2)) {
        int j;
        if (i < k) {

            j = (int)(((i + k - 1)) / 2);
```

Stop the recursion when no more divisions can be made

Determine where to divide the elements

# Original Version of Mergesort

```
if (mgsort(data, size, esize, i, j, compare) < 0){
    return -1;
}

if (mgsort(data, size, esize, j + 1, k, compare) < 0){
    return -1;
}
```

Recursively sort the two divisions

# Original Version of Mergesort

Recursively sort the two divisions

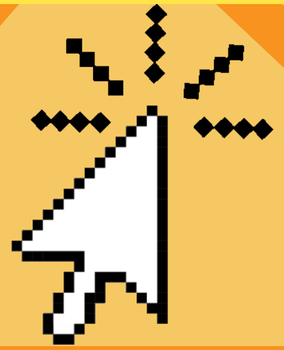
```
    if (mgsort(data, size, esize, i, j, compare) < 0){
        return -1;
    }
    if (mgsort(data, size, esize, j + 1, k, compare) < 0){
        return -1;
    }

    if (merge(data, esize, i, j, k, compare) < 0){
        return -1;
    }
}
return 0;
}
```

Merge the two sorted divisions into a single sorted set

# Mergesort Variations on the Net

from: Lance



## Abstract In-place

1

Sorting the first half of the array in place, then sorting the second half of the array in place, then do the merge of the two halves by moving the items around within the array.

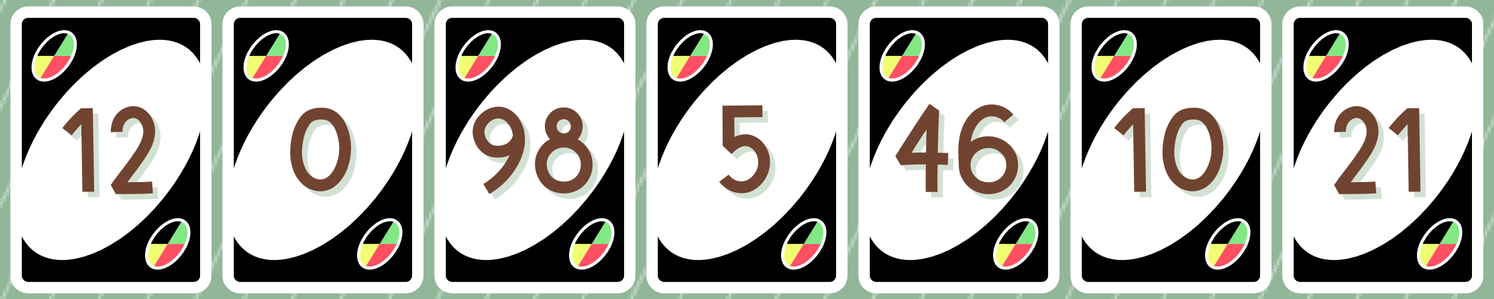
# MergeSort Simulation



Steps

Let's note the steps as we go along!

# MergeSort Simulation

Find midPoint of array; split evenly

1. call MergeSort for left half
2. call MergeSort for right half
3. merge the two halves

## Steps

Find the mid-point to divide array in half , as evenly as possible

# MergeSort Simulation

Find midPoint of array; split evenly

1. call MergeSort for left half
2. call MergeSort for right half
3. merge the two halves

**Steps**

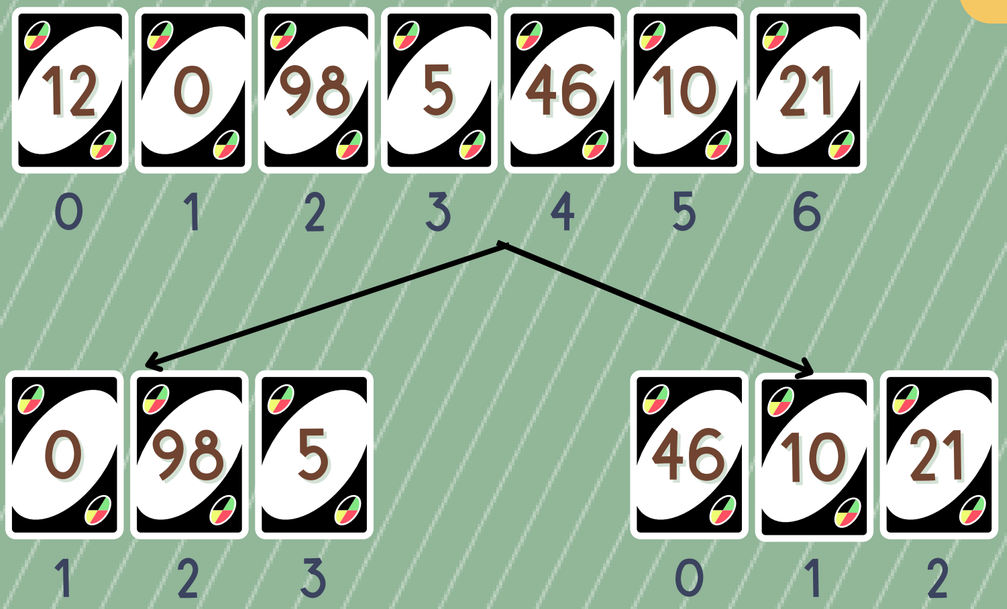
Find the mid-point to divide array in half , as evenly as possible

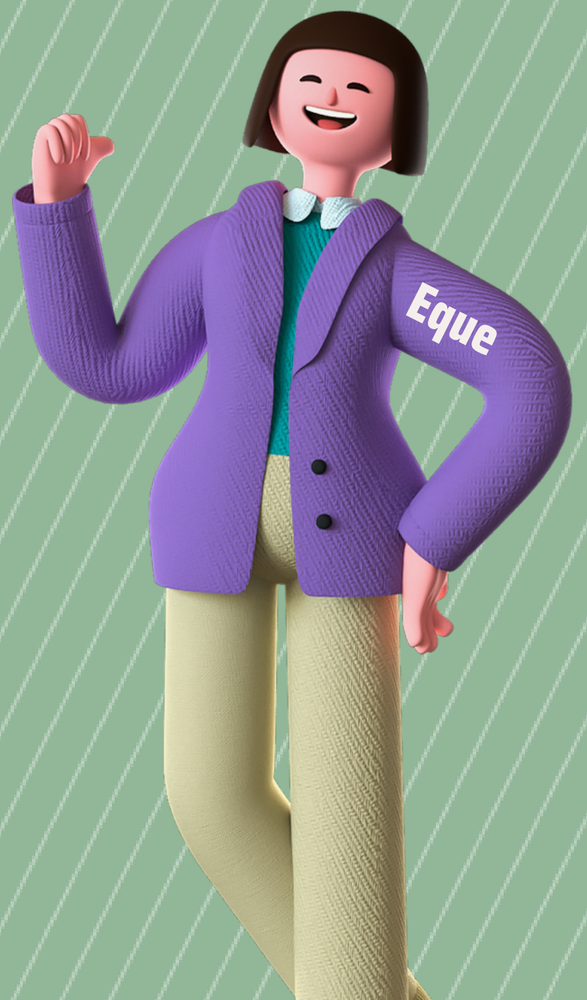
# MergeSort Simulation

Find midPoint of array;
split evenly

1. call MergeSort for left half
2. call MergeSort for right half
3. merge the two halves

Find the mid-point to divide array in half , as evenly as possible



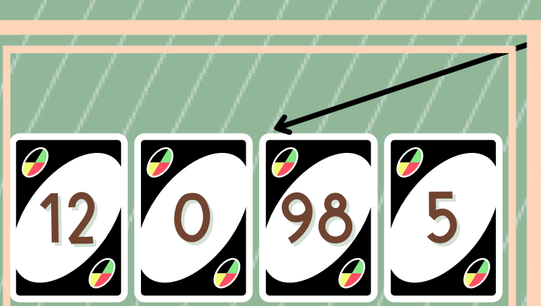


# MergeSort Simulation

Find midPoint of array;
split evenly

1. call MergeSort for left half
2. call MergeSort for right half
3. merge the two halves

Find the mid-point to divide array in half , as evenly as possible



## Steps

start with the left sub-array

# MergeSort Simulation

Find midPoint of array:
split evenly

1. call MergeSort for left half
2. call MergeSort for right half
3. merge the two halves

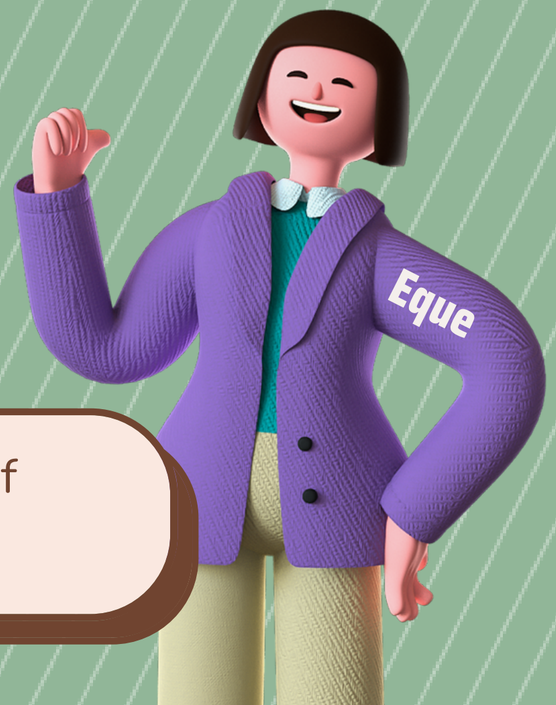
Find the mid-point to divide array in half , as evenly as possible

if arrayLength of Left SubArray is more than 1, repeat previous step

midpoint

## Steps

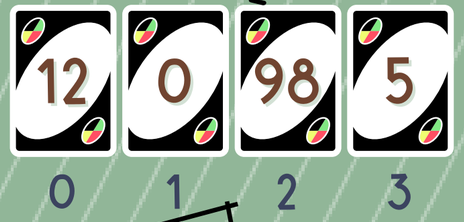
Keep splitting the left subarrays in half until there is ONE left in the array.

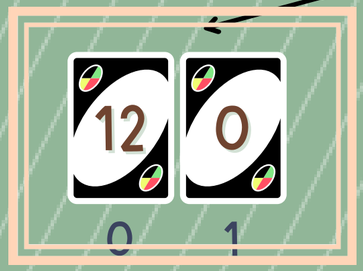


# MergeSort Simulation

Find midPoint of array;
split evenly

1. call MergeSort for left half
2. call MergeSort for right half
3. merge the two halves





Find the mid-point to divide array in half , as evenly as possible

if arrayLength of Left SubArray is more than 1, repeat previous step

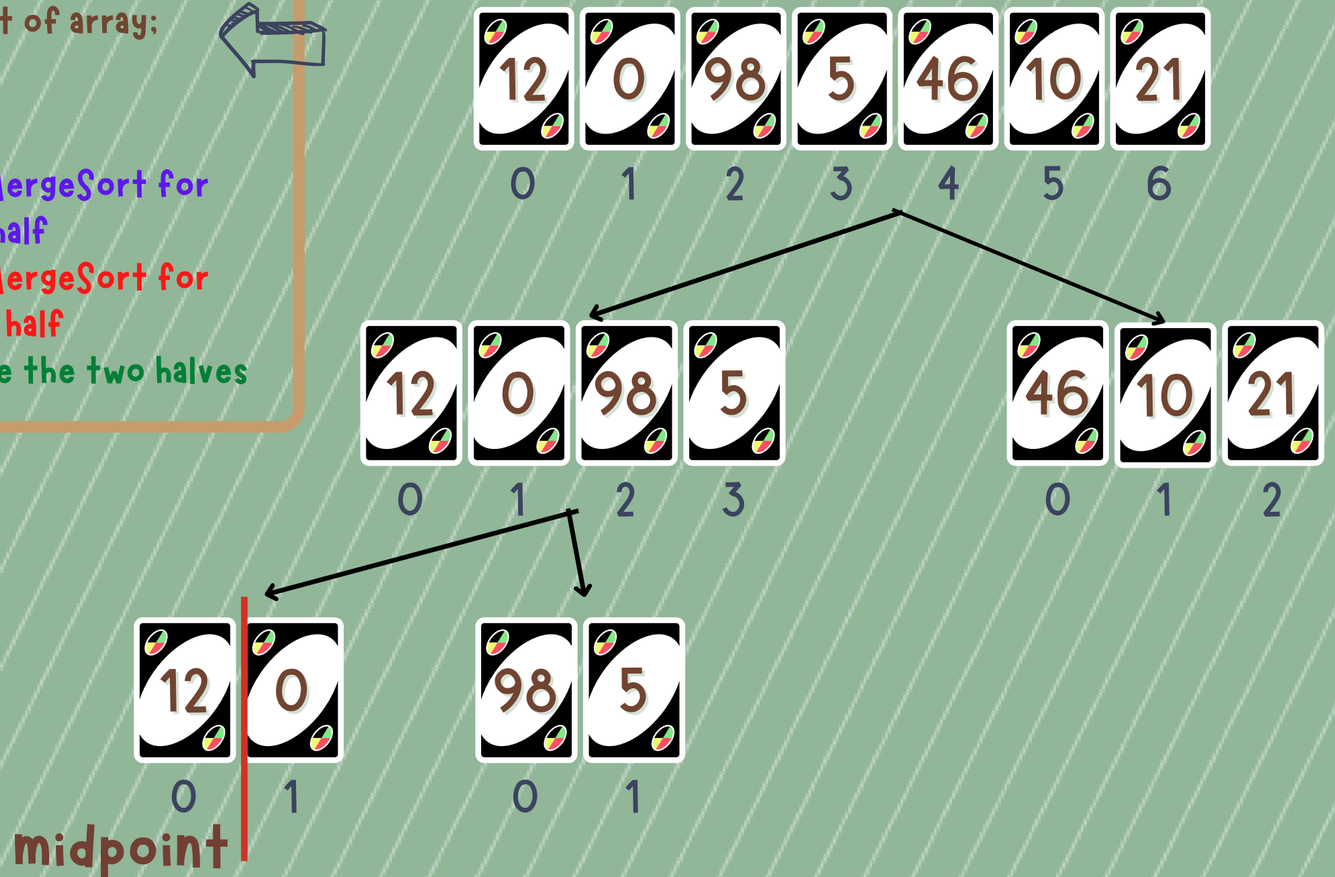
**Steps**

Keep splitting the left subarrays in half until there is ONE left in the array.

# MergeSort Simulation

Find midPoint of array; split evenly

1. call MergeSort for left half
2. call MergeSort for right half
3. merge the two halves



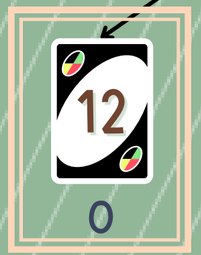
Find the mid-point to divide array in half , as evenly as possible

if arrayLength of Left SubArray is more than 1, repeat previous step

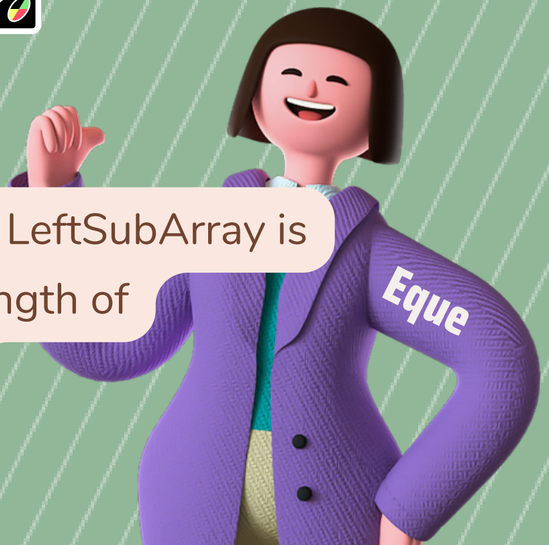
# MergeSort Simulation

Find midPoint of array;
split evenly

1. call MergeSort for left half
2. call MergeSort for right half
3. merge the two halves



if arrayLength of LeftSubArray is 1, check arrayLength of RighSubArray



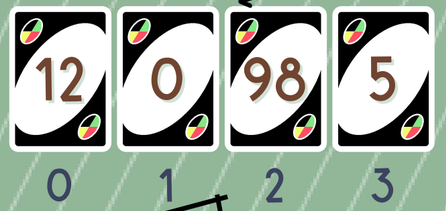
Find the mid-point to divide array in half , as evenly as possible

if arrayLength of Left SubArray is more than 1, repeat previous step

# MergeSort Simulation

Find midPoint of array;
split evenly

1. call MergeSort for left half
2. call MergeSort for right half
3. merge the two halves



If ArrayLength of RightSubArray is also 1, ready to merge. Else, repeat 2nd step - but for RightSubArray instead of Left

Find the mid-point to divide array in half , as evenly as possible

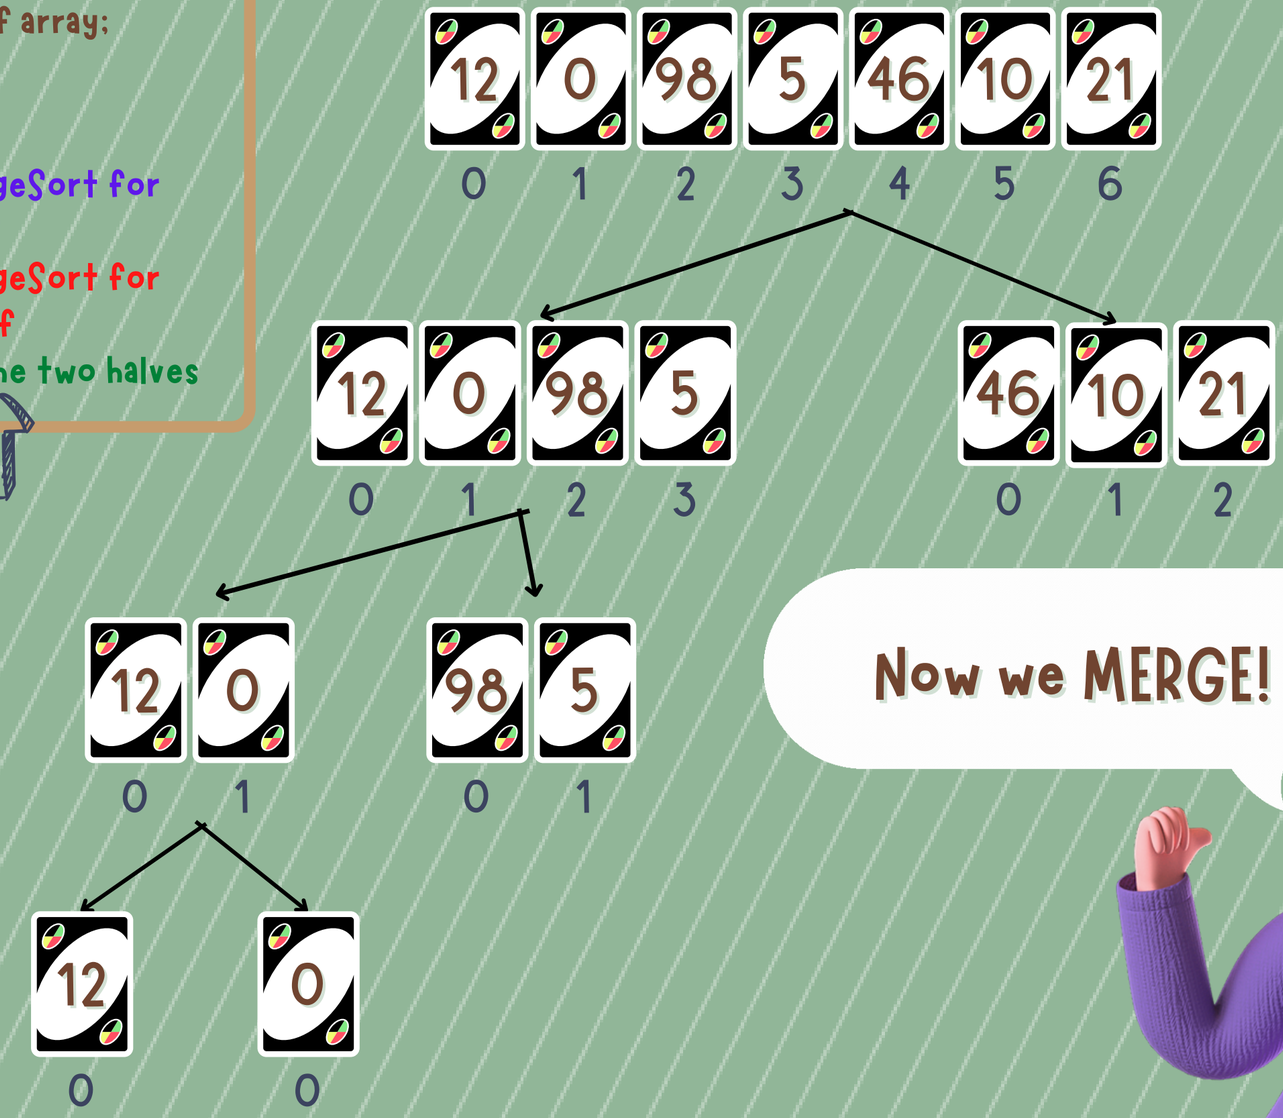
if arrayLength of Left SubArray is more than 1, repeat previous step

if arrayLength of LeftSubArray is 1, check arrayLength of RighSubArray

# MergeSort Simulation

Find midPoint of array;
split evenly

1. call MergeSort for left half
2. call MergeSort for right half
3. merge the two halves



Now we MERGE!

Find the mid-point to divide array in half , as evenly as possible

if arrayLength of Left SubArray is more than 1, repeat previous step

if arrayLength of LeftSubArray is 1, check arrayLength of RighSubArray

If ArrayLength of RightSubArray is also 1, ready to merge. Else, repeat 2nd step - but for RightSubArray instead of Left

# MergeSort Simulation

Find midPoint of array; split evenly

1. call MergeSort for left half
2. call MergeSort for right half
3. merge the two halves

Select both subArrays, and merge them together in Sorted order

Find the mid-point to divide array in half , as evenly as possible

if arrayLength of Left SubArray is more than 1, repeat previous step

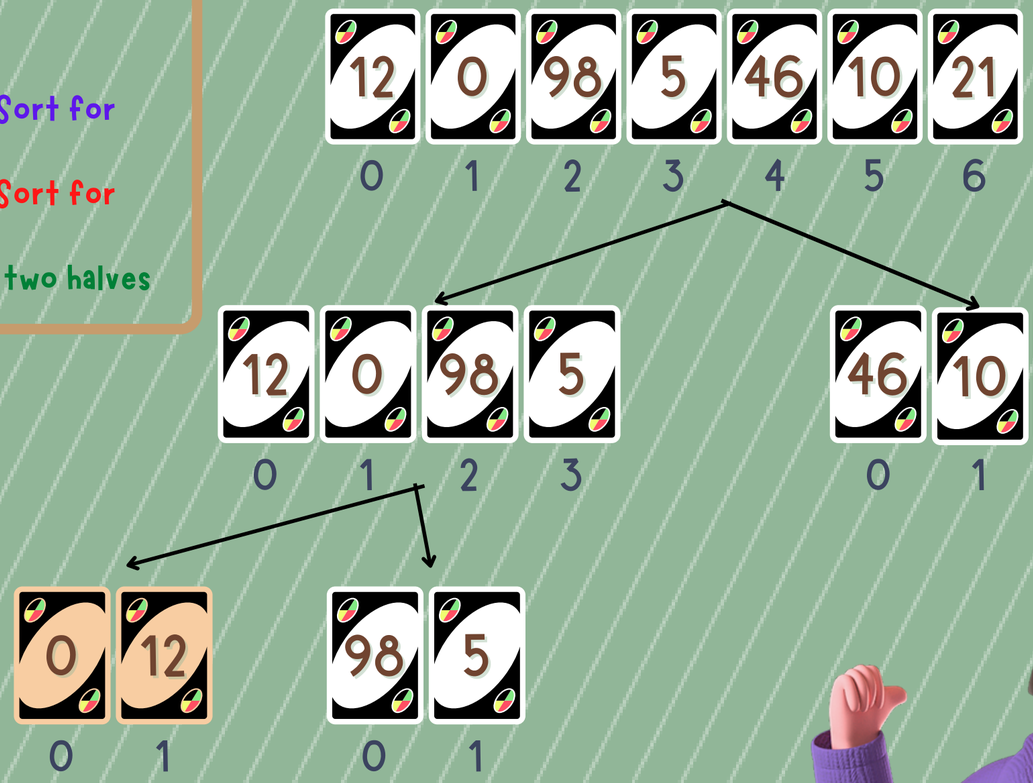
if arrayLength of LeftSubArray is 1, check arrayLength of RighSubArray

If ArrayLength of RightSubArray is also 1, ready to merge. Else, repeat 2nd step - but for RightSubArray instead of Left

# MergeSort Simulation

Find midPoint of array;
split evenly

1. call MergeSort for left half
2. call MergeSort for right half
3. merge the two halves



Find the mid-point to divide array in half , as evenly as possible

if arrayLength of Left SubArray is more than 1, repeat previous step

if arrayLength of LeftSubArray is 1, check arrayLength of RighSubArray

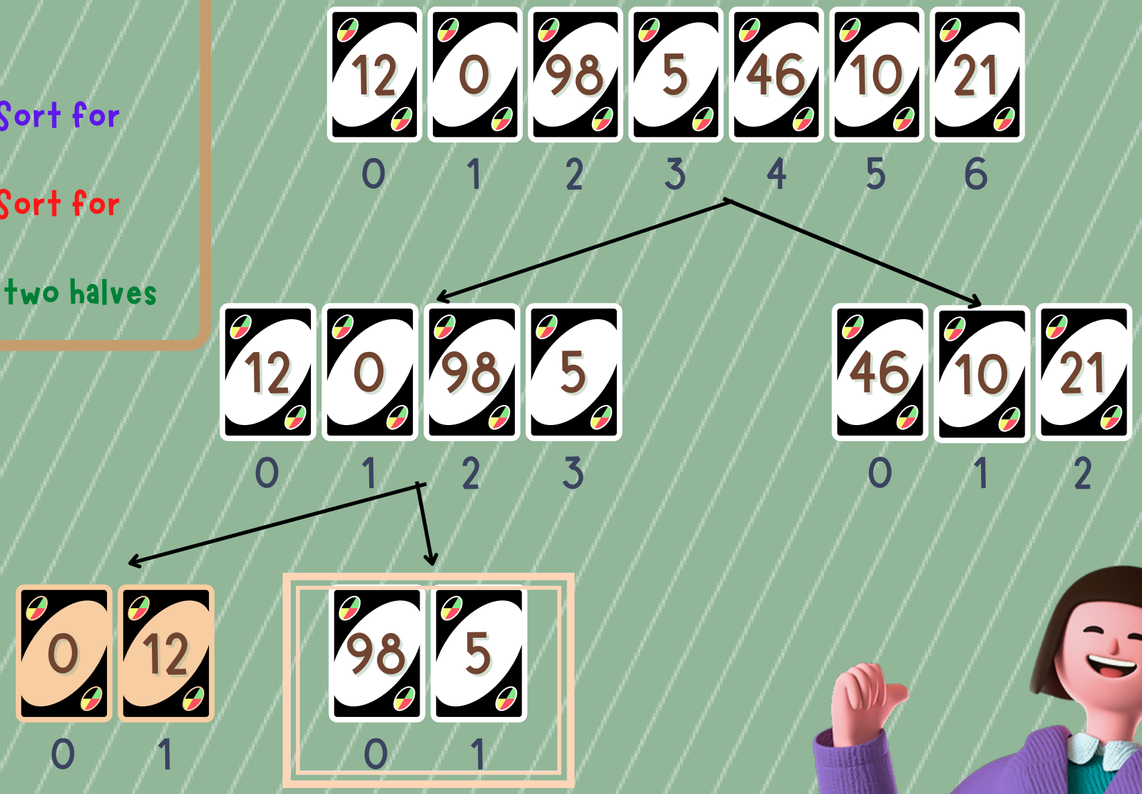
If ArrayLength of RightSubArray is also 1, ready to merge. Else, repeat 2nd step - but for RightSubArray instead of Left

Select both subArrays, and merge them together in Sorted order

# MergeSort Simulation

Find midPoint of array;
split evenly

1. call MergeSort for left half
2. call MergeSort for right half
3. merge the two halves



Find the mid-point to divide array in half , as evenly as possible

if arrayLength of Left SubArray is more than 1, repeat previous step

if arrayLength of LeftSubArray is 1, check arrayLength of RighSubArray

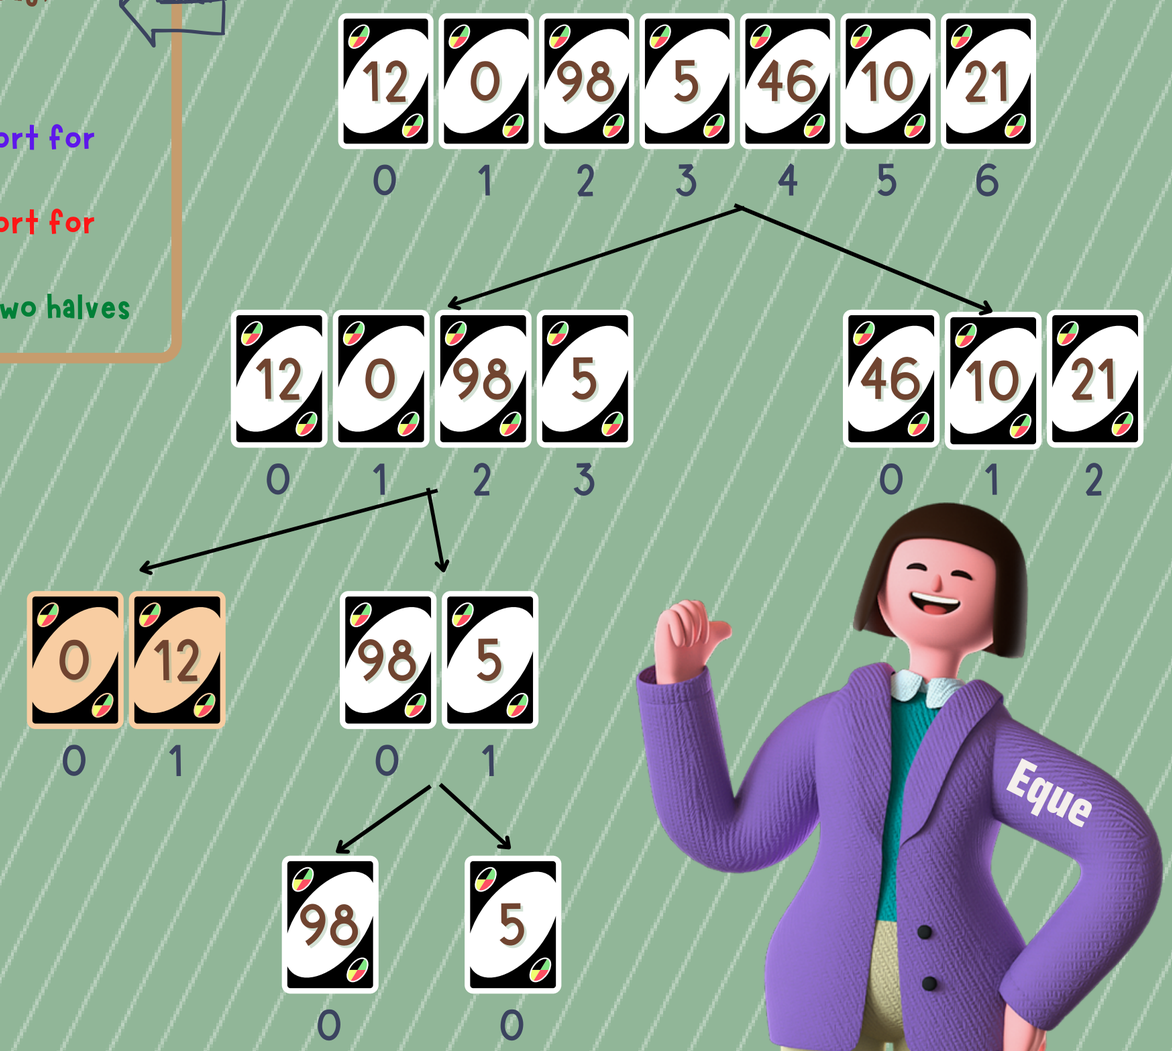
If ArrayLength of RightSubArray is also 1, ready to merge. Else, repeat 2nd step - but for RightSubArray instead of Left

Select both subArrays, and merge them together in Sorted order

# MergeSort Simulation

Find midPoint of array; split evenly

1. call MergeSort for left half
2. call MergeSort for right half
3. merge the two halves



Find the mid-point to divide array in half , as evenly as possible

if arrayLength of RIGHT SubArray is more than 1, repeat previous step

if arrayLength of LeftSubArray is 1, check arrayLength of RighSubArray

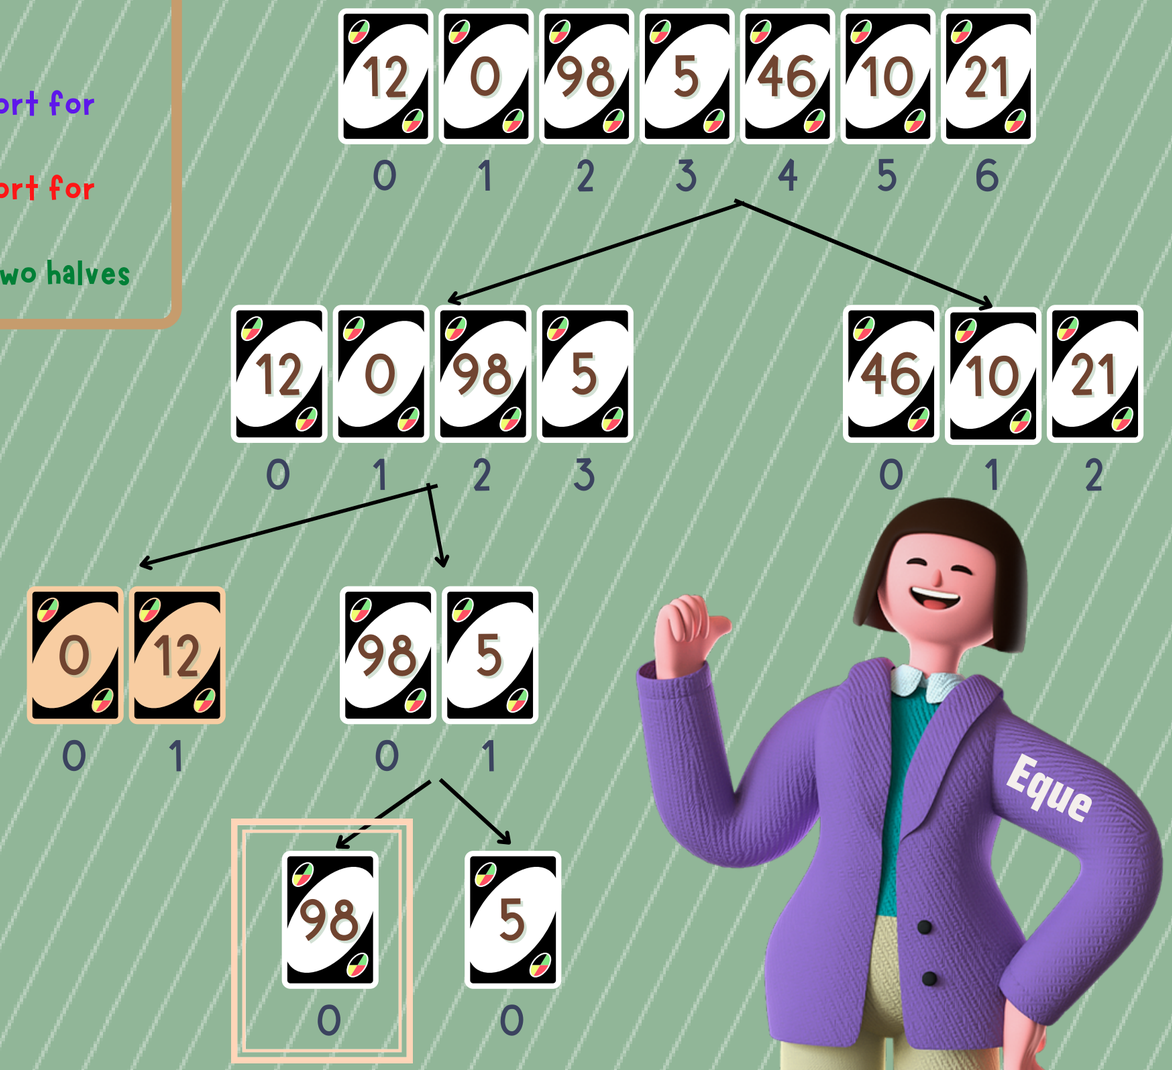
If ArrayLength of RightSubArray is also 1, ready to merge. Else, repeat 2nd step - but for RightSubArray instead of Left

Select both subArrays, and merge them together in Sorted order

# MergeSort Simulation

Find midPoint of array;
split evenly

1. call MergeSort for left half
2. call MergeSort for right half
3. merge the two halves



Find the mid-point to divide array in half , as evenly as possible

if arrayLength of RIGHT SubArray is more than 1, repeat previous step

if arrayLength of LeftSubArray is 1, check arrayLength of RighSubArray

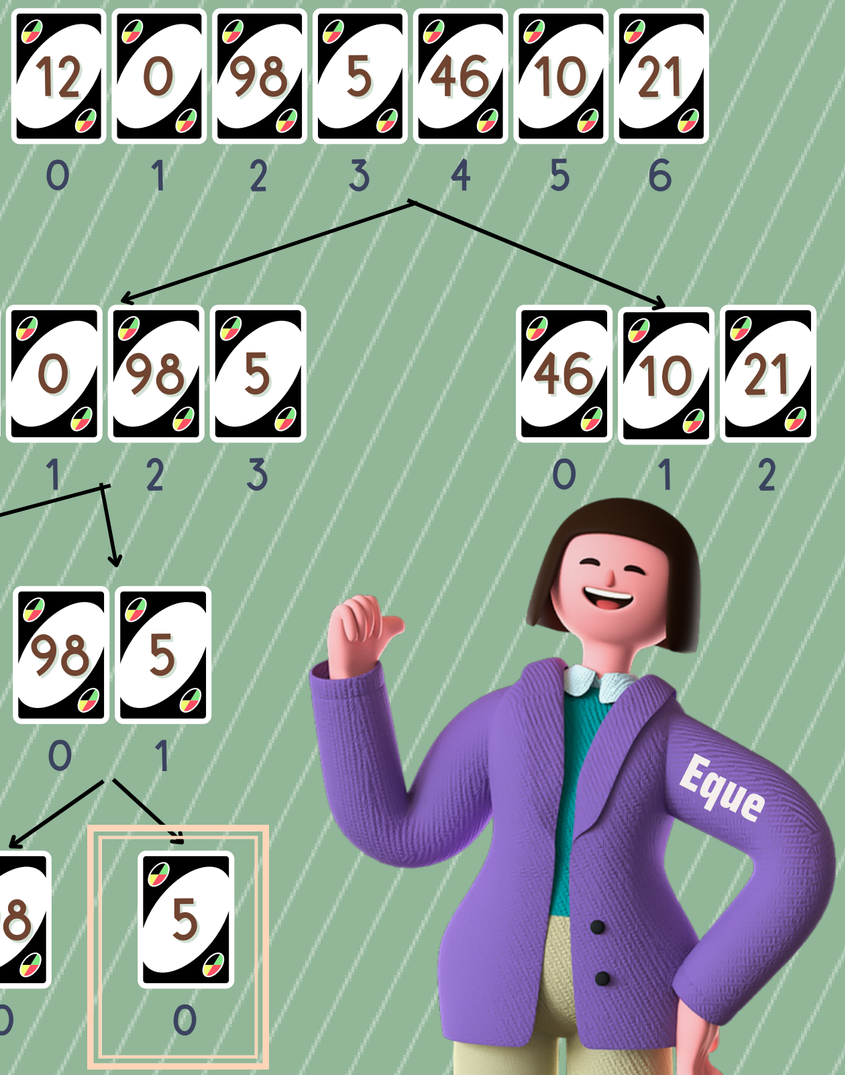
If ArrayLength of RightSubArray is also 1, ready to merge. Else, repeat 2nd step - but for RightSubArray instead of Left

Select both subArrays, and merge them together in Sorted order

# MergeSort Simulation

Find midPoint of array;
split evenly

1. call MergeSort for left half
2. call MergeSort for right half
3. merge the two halves



Find the mid-point to divide array in half , as evenly as possible

if arrayLength of RIGHT SubArray is more than 1, repeat previous step

if arrayLength of LeftSubArray is 1, check arrayLength of RighSubArray

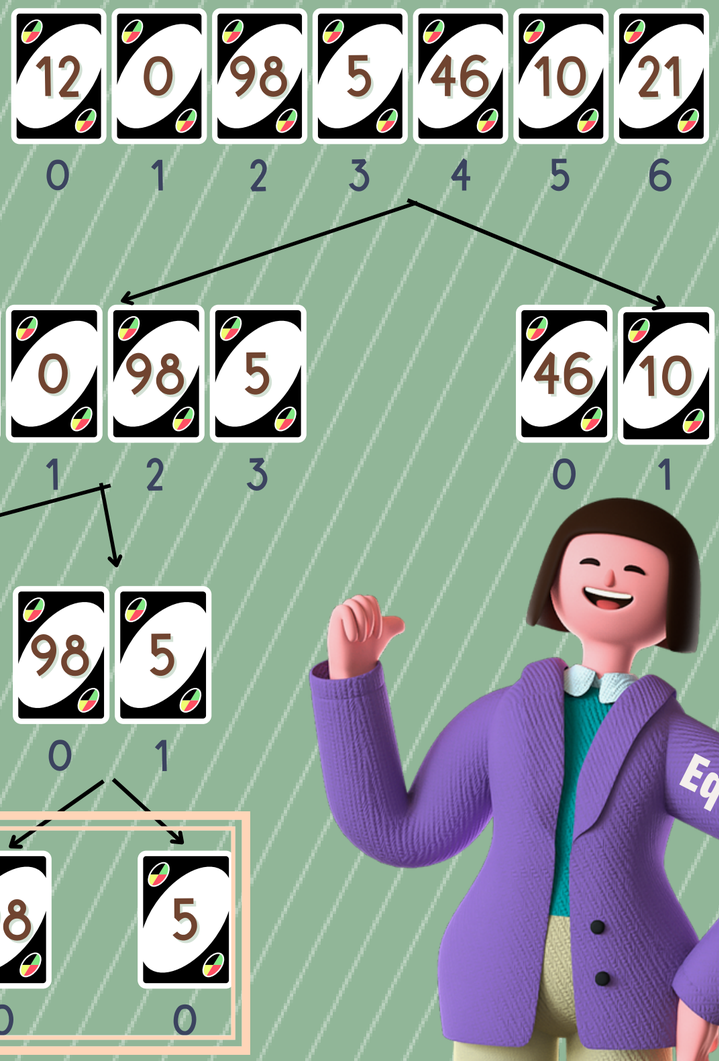
If ArrayLength of RightSubArray is also 1, ready to merge. Else, repeat 2nd step - but for RightSubArray instead of Left

Select both subArrays, and merge them together in Sorted order

# MergeSort Simulation

Find midPoint of array; split evenly

1. call MergeSort for left half
2. call MergeSort for right half
3. merge the two halves



Find the mid-point to divide array in half , as evenly as possible

if arrayLength of RIGHT SubArray is more than 1, repeat previous step

if arrayLength of LeftSubArray is 1, check arrayLength of RighSubArray

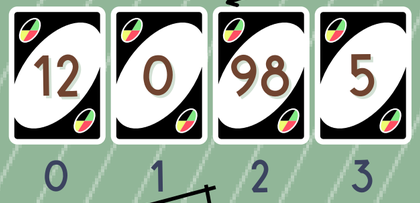
If ArrayLength of RightSubArray is also 1, ready to merge. Else, repeat 2nd step - but for RightSubArray instead of Left

Select both subArrays, and merge them together in Sorted order

# MergeSort Simulation

Find midPoint of array;
split evenly

1. call MergeSort for left half
2. call MergeSort for right half
3. merge the two halves



Find the mid-point to divide array in half , as evenly as possible

if arrayLength of RIGHT SubArray is more than 1, repeat previous step

if arrayLength of LeftSubArray is 1, check arrayLength of RighSubArray

If ArrayLength of RightSubArray is also 1, ready to merge. Else, repeat 2nd step - but for RightSubArray instead of Left

Select both subArrays, and merge them together in Sorted order

# MergeSort Simulation

Find midPoint of array;
split evenly

1. call MergeSort for left half
2. call MergeSort for right half
3. merge the two halves

Find the mid-point to divide array in half , as evenly as possible

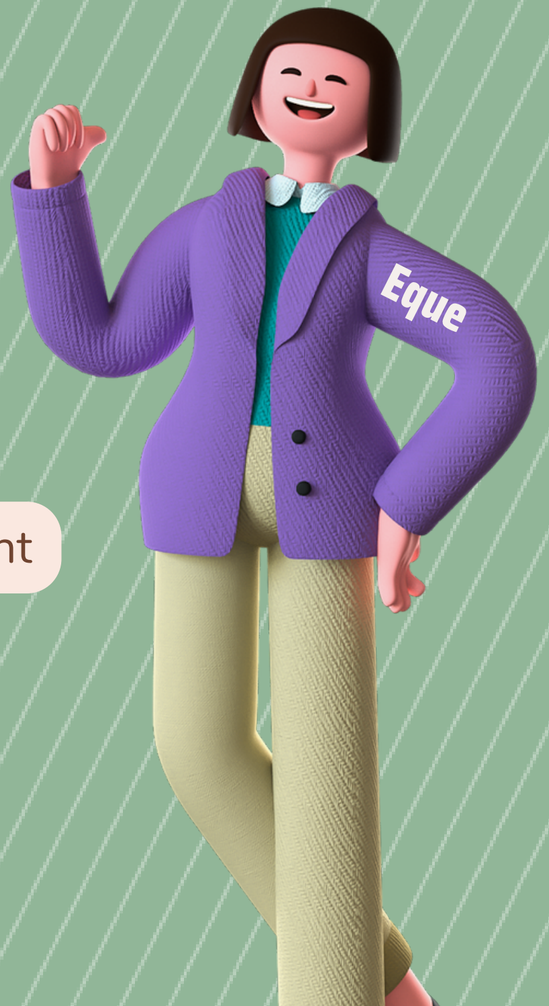
if arrayLength of RIGHT SubArray is more than 1, repeat previous step

if arrayLength of LeftSubArray is 1, check arrayLength of RighSubArray

If ArrayLength of RightSubArray is also 1, ready to merge. Else, repeat 2nd step - but for RightSubArray instead of Left

Select both subArrays, and merge them together in Sorted order

1. compare and take the smallest value from the front of each array



# MergeSort Simulation

Find midPoint of array;
split evenly

1. call MergeSort for left half
2. call MergeSort for right half
3. merge the two halves

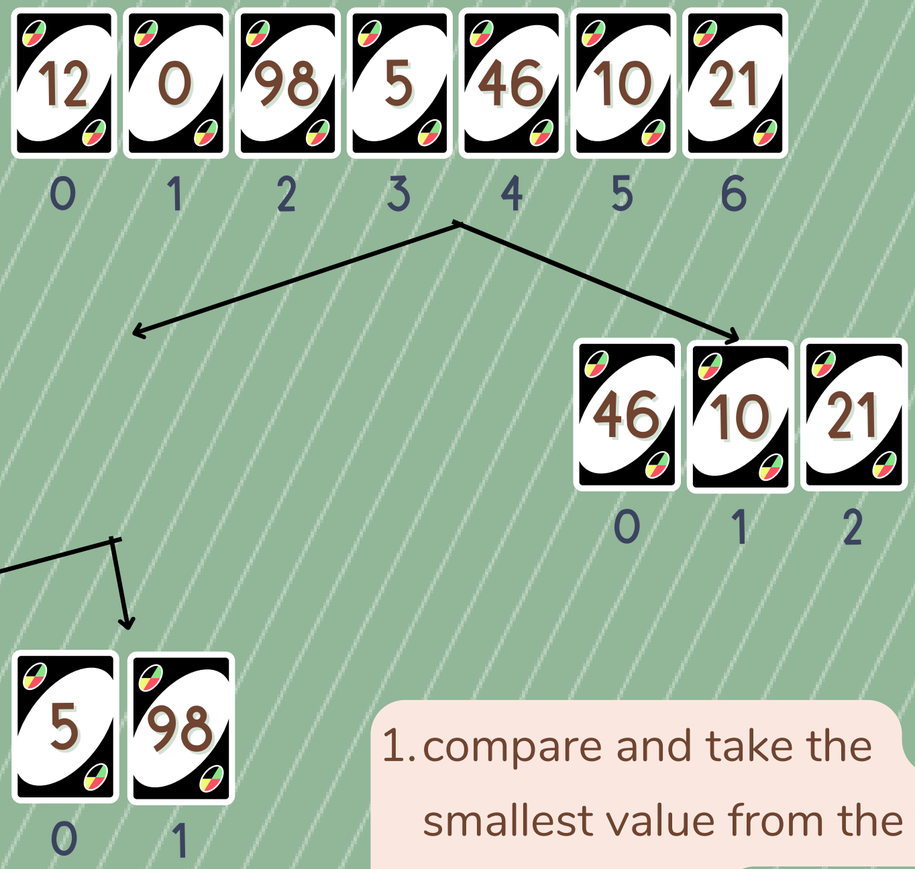
Find the mid-point to divide array in half , as evenly as possible

if arrayLength of RIGHT SubArray is more than 1, repeat previous step

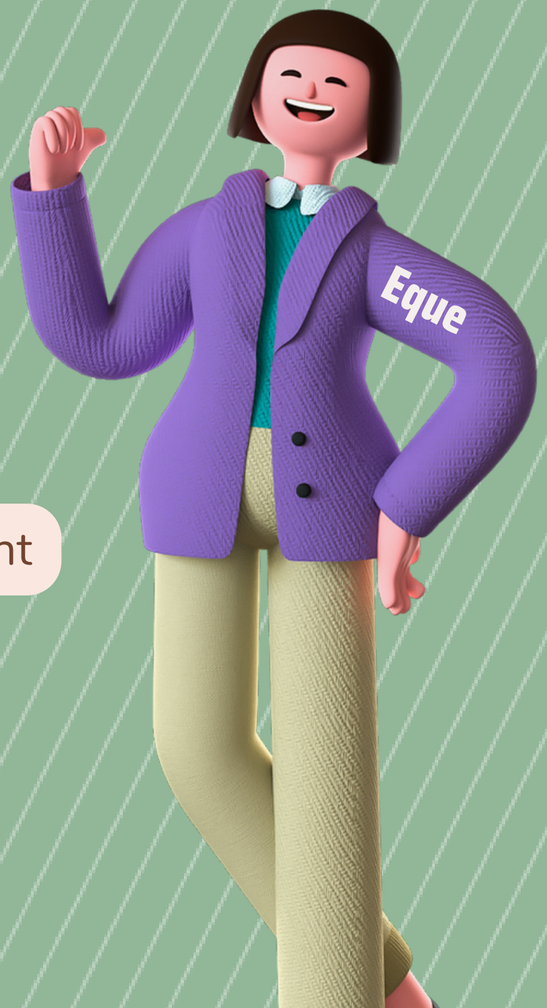
if arrayLength of LeftSubArray is 1, check arrayLength of RighSubArray

If ArrayLength of RightSubArray is also 1, ready to merge. Else, repeat 2nd step - but for RightSubArray instead of Left

Select both subArrays, and merge them together in Sorted order



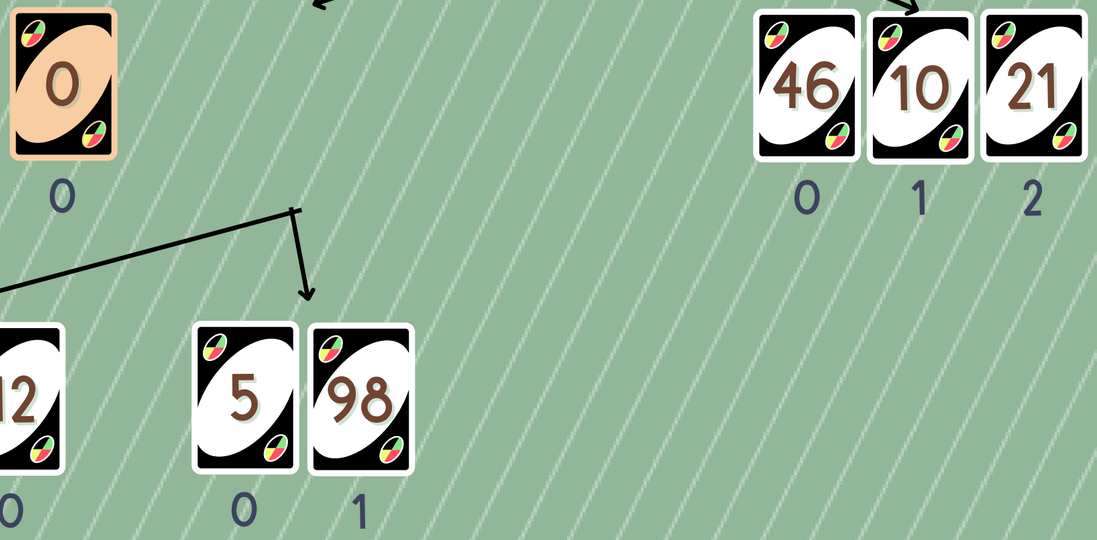
1. compare and take the smallest value from the front of each array



# MergeSort Simulation

Find midPoint of array;
split evenly

1. call MergeSort for left half
2. call MergeSort for right half
3. merge the two halves



compare and take the smallest value from the front of each array

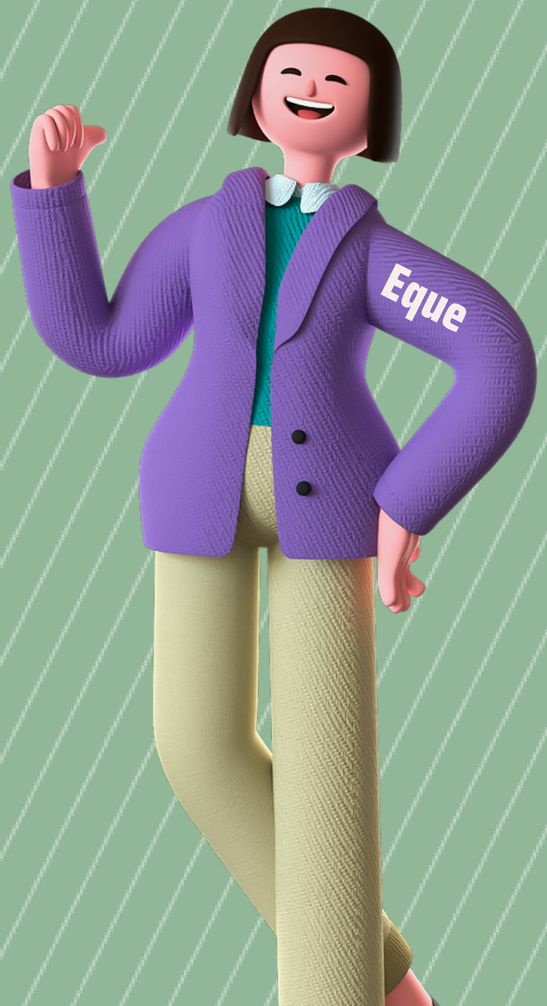
Find the mid-point to divide array in half , as evenly as possible

if arrayLength of RIGHT SubArray is more than 1, repeat previous step

if arrayLength of LeftSubArray is 1, check arrayLength of RighSubArray

If ArrayLength of RightSubArray is also 1, ready to merge. Else, repeat 2nd step - but for RightSubArray instead of Left

Select both subArrays, and merge them together in Sorted order



# MergeSort Simulation

Find midPoint of array;
split evenly

1. call MergeSort for left half
2. call MergeSort for right half
3. merge the two halves

Find the mid-point to divide array in half , as evenly as possible

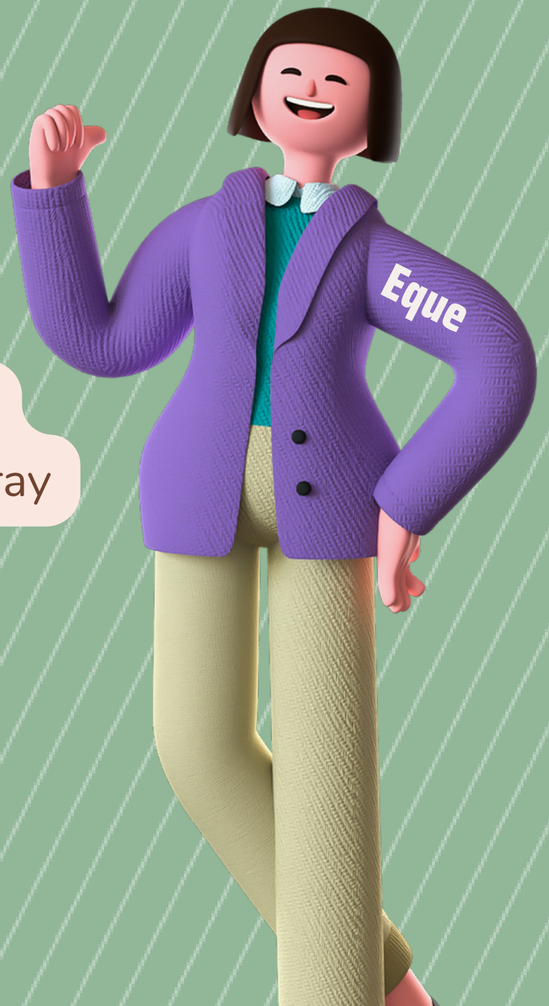
if arrayLength of RIGHT SubArray is more than 1, repeat previous step

if arrayLength of LeftSubArray is 1, check arrayLength of RighSubArray

If ArrayLength of RightSubArray is also 1, ready to merge. Else, repeat 2nd step - but for RightSubArray instead of Left

Select both subArrays, and merge them together in Sorted order

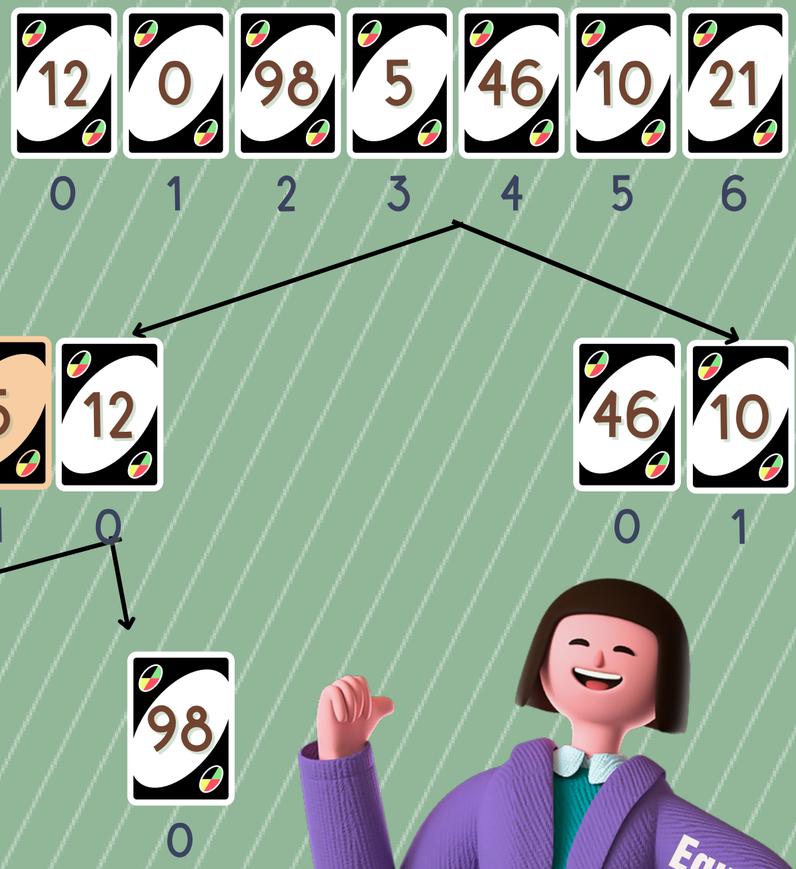
compare and take the smallest value from the front of each array



# MergeSort Simulation

Find midPoint of array;
split evenly

1. call MergeSort for left half
2. call MergeSort for right half
3. merge the two halves



Find the mid-point to divide array in half , as evenly as possible

if arrayLength of RIGHT SubArray is more than 1, repeat previous step

if arrayLength of LeftSubArray is 1, check arrayLength of RighSubArray

If ArrayLength of RightSubArray is also 1, ready to merge. Else, repeat 2nd step - but for RightSubArray instead of Left

Select both subArrays, and merge them together in Sorted order

since one of the arrays is already empty, simply copy the remaining values of the remaining array into the sorted array

# MergeSort Simulation

Find midPoint of array; split evenly

1. call MergeSort for left half
2. call MergeSort for right half
3. merge the two halves

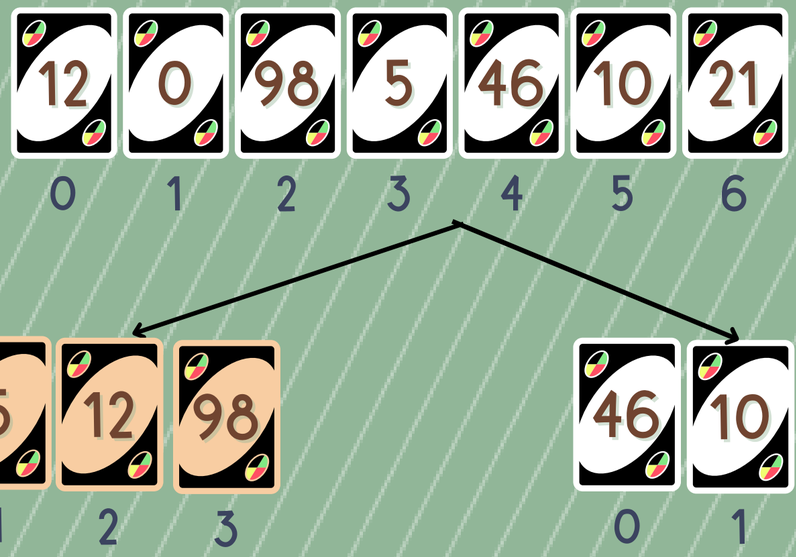
Find the mid-point to divide array in half , as evenly as possible

if arrayLength of RIGHT SubArray is more than 1, repeat previous step

if arrayLength of LeftSubArray is 1, check arrayLength of RighSubArray

If ArrayLength of RightSubArray is also 1, ready to merge. Else, repeat 2nd step - but for RightSubArray instead of Left

Select both subArrays, and merge them together in Sorted order



Now, repeat the same process with the right half

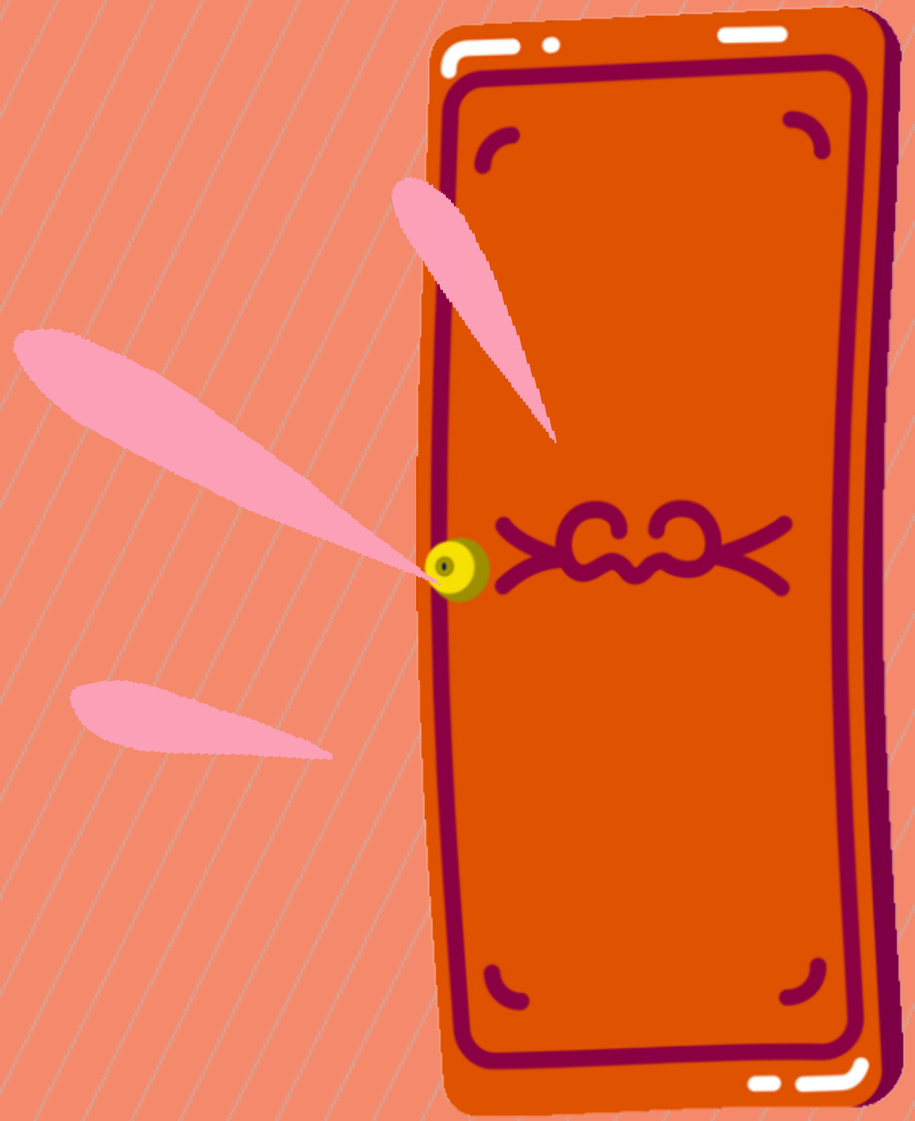
Internet vs Group's code

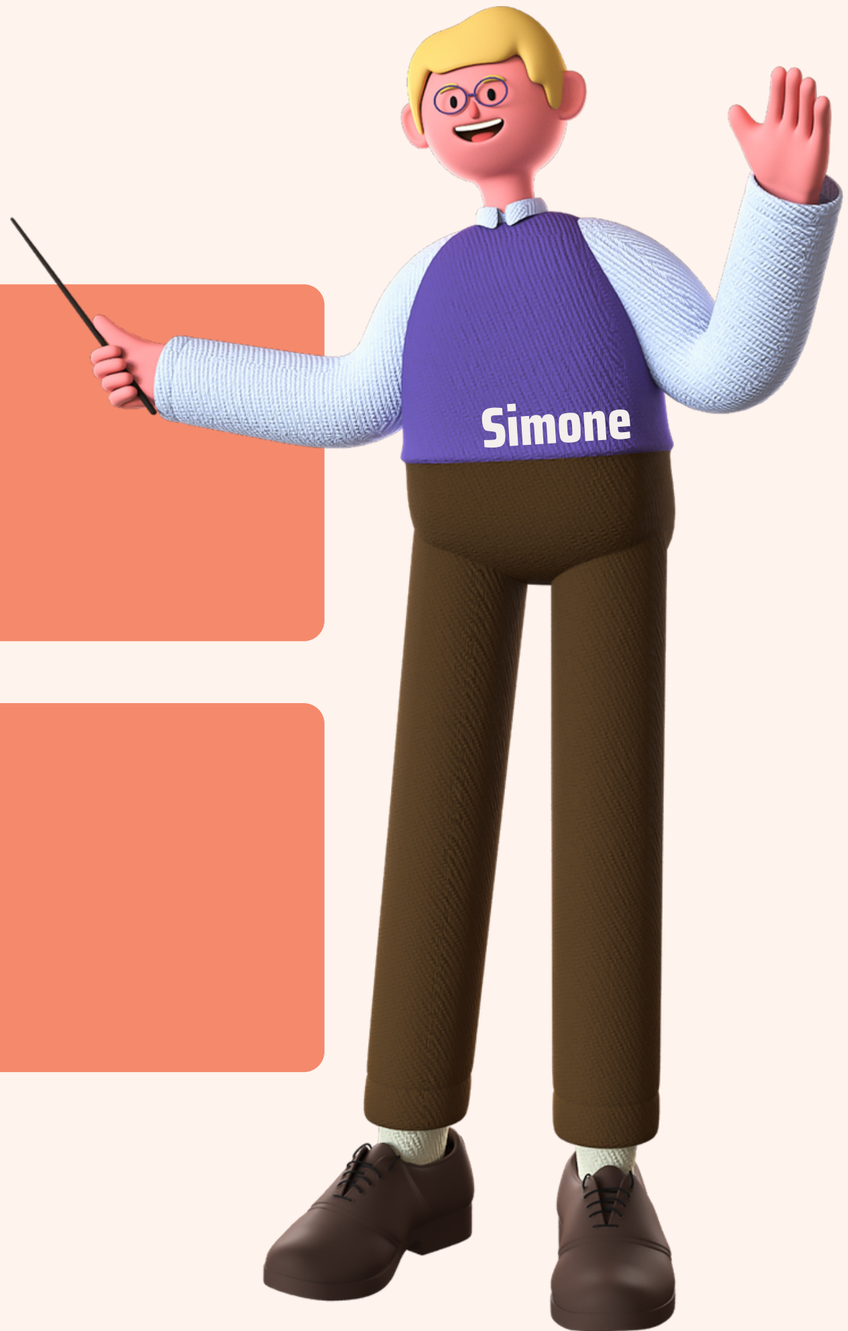
it's Simone



# Functions

- mergeSort( int arr[], int l, int r)
  - Divides the input array into halves.

- merge( int arr[], int l,int m, int r)
  - Merges the two sorted array.



# mergeSort Function

```
void mergeSort( int arr[], int l, int r ) {
        if (l < r) {

            int m = ( l + r ) / 2;

            mergeSort(arr, l, m);
            mergeSort(arr, m + 1, r);

            merge( arr, l, m, r );
        }
}
```

Finding mid element

Recursively sorting both the halves

Merge the array

## Internet merge Function

```
void merge(int arr[], int l, int m, int r) {
        int i, j, k;
        int n1 = m - l + 1;
        int n2 = r - m;

        int L[n1], R[n2];

        for (i = 0; i < n1; i++){
            L[i] = arr[l + i];
        }
        for (j = 0; j < n2; j++){
            R[j] = arr[m + 1+ j];
        }
```

Create temp arrays

Copy data to temp array

## Groups merge Function

```
void merge(int arr[], int l, int m, int r) {
        int i, j, k;
        int size1 = m - l + 1;
        int size = r - l + 1;

        int temp[size];

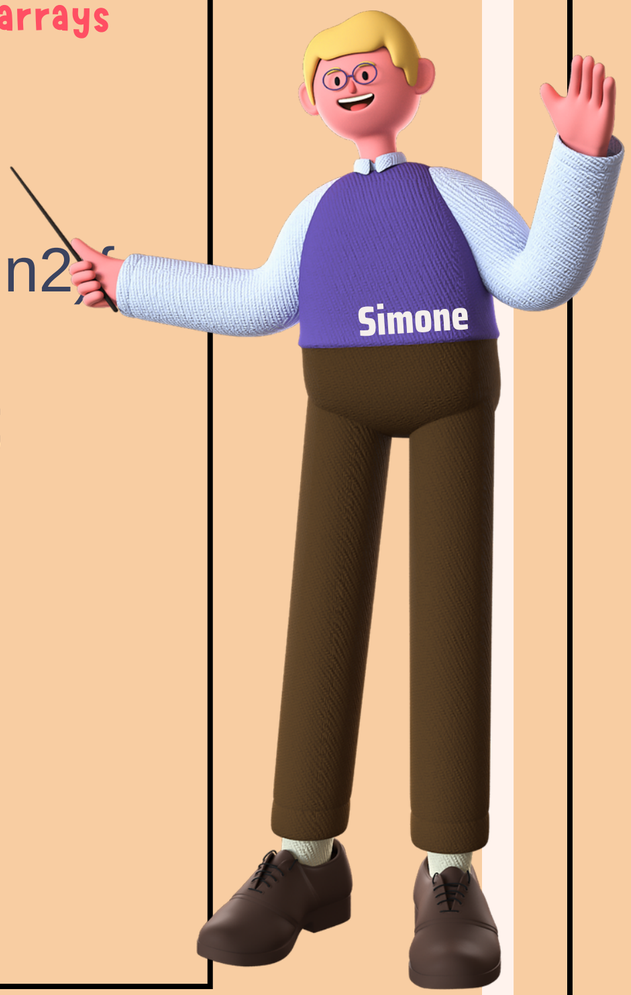
        for(i=0; i<size; i++) {
            temp[i] = arr[l+i];
        }
```

Create 1 temp array

1 loop to copy data to temp

# Internet merge Function

```
Merge the temp arrays
i = 0;
j = 0;
k = l;
while (i < n1 && j < n2) {
        if (L[i] <= R[j]){
              arr[k] = L[i];
              i++;
        } else {
              arr[k] = R[j];
              j++;
        }
        k++;
}
```



# Group's merge Function

```
    i = 0;
    j = size1;
    k = l;

    while(i<size1 && j<size) {
          if(temp[i] < temp[j]) {
                arr[k] = temp[i];
                i++;
          } else {
                arr[k] = temp[j];
                j++;
          }
          k++;
    }
```

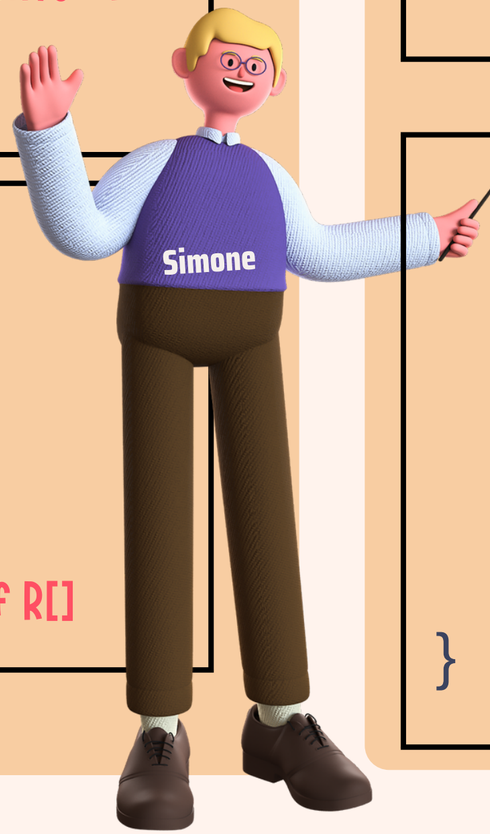
# Internet merge Function

```
while (i < n1){
        arr[k] = L[i];
        i++;
        k++;
}
```

Copy the remaining elements of L[]

```
while (j < n2){
        arr[k] = R[j];
        j++;
        k++;
}
}
```

Copy the remaining elements of R[]



# Group's merge Function

```
if(j<size) {
    i = j;
    size1 = size;
}
```

Check where to start copying the remaining elements

```
while (i<size1) {
        arr[k] = temp[i];
        k++;
        i++;
}
}
```

Copy the remaining elements of temp

# Thank You

SEE YOU NEXT TIME
